

Highlights

The Camouflage Ratio: Strategic Tie Formation and the Limits of Structural Detection

- Camouflage has two ends: it contaminates the majority's alters at rate $\eta = c \cdot \rho$
- Prevalence protects attackers: the commoner they are, the less camouflage each needs
- A closed form marks where averaging over alters stops beating attributes alone
- Discarding suspicious ties trades bias against the ties left to average over
- On 10,199 labelled Twitter accounts, every recorded relation harms the inference
